Quick Guide to Variables in the 2024 GSS Cross-section (Release 3)

Background on Released Variables

The 2024 GSS was implemented using the 2022 experimental design to continue supporting the transition from a traditional face-to-face study to a multimode approach, incorporating web-based data collection tools and collect data more cost effectively. Continued forward from the 2022 GSS, this design made the 2024 GSS data collection more efficient and allowed respondents to have more flexibility in how they preferred to complete the survey. The experimental design is described in detail in the 2024 GSS Codebook.

All of the variables that users might consider standard for a complete GSS data release based on the GSS Replicating Core are below. Additionally, all variables from topical modules in the 2024 GSS Cross-section are displayed. Variables appear in one of three forms: bolded, regular, or as strike text.

- Bold variables (e.g., **EXAMPLE**) are included in the 2024 GSS Cross-section Release 3 (R3).
- Regular variables (e.g., EXAMPLE) are not included in the 2024 GSS Cross-section R3 but will be included in a future release.
- Strike variables (e.g., ~~EXAMPLE~~) will not be released in the 2024 GSS Cross-section data, as they were not part of the 2024 GSS Cross-section. Variables were excluded because of survey mode changes, decisions by the GSS Scientific Advisory Board, or other reasons. Variables which are not available on the 2024 GSS Cross-section may be included in future rounds of the GSS.

Additionally, some variables are colored red (e.g., EXAMPLE). These variables are new to the GSS as of 2024 GSS.

Finally, an asterisk (*) denotes variables where response categories have been coarsened or changed from earlier cross-sections and a dagger (†) denotes variables which were collected in 2024 but will only be released through a restricted file. For more details on this change, please see the 2024 GSS Codebook.
