

WHO, WHAT, WHEN, WHERE, AND WHY: AN ANALYSIS OF USAGE OF
THE GENERAL SOCIAL SURVEY, 1972-1983

By Tom W. Smith

GSS Technical Report No. 48
National Opinion Research Center

August, 1984

This research was done for the General Social Survey Project directed by James A. Davis and Tom W. Smith. The project is supported by the National Science Foundation, Grant No. SES-8118731.

The National Data Program for the Social Sciences is a data diffusion project and program of social indicators research. Annually from 1972 to 1978 and in 1980, 1982, 1983 and 1984 the National Opinion Research Center (NORC), supported by grants from the National Science Foundation, has conducted a General Social Survey (GSS). The GSSs contain a wide range of demographics covering respondent and parental characteristics; behavioral items such as group membership and voting; personal, psychological evaluations of happiness, misanthropy, life satisfactions, and other aspects; and attitudinal questions on such public issues as abortions, crime and punishment, race relations, sex roles, and spending priorities. The GSS questions are replicated either each survey or according to a fixed rotation pattern. In addition since many GSS questions were chosen from previous surveys, the GSS points not only serve as base years for the building of social indicators series, but also as contemporary anchors for series already up to three decades long.

The National Data Program for the Social Sciences has made the GSS data available at cost to all interested parties for use in research, teaching, or other applications. Each survey is publicly available within a few months of collection and is distributed by the Roper Center, University of Connecticut and the Inter-university Consortium for Political and Social Research, University of Michigan.

This report analyzes the usage patterns of the GSSs by examining the papers that have employed the GSSs as part of their data base. The Annotated Bibliography of Papers Using the General Social Surveys (1984), lists 1,072 papers using the GSS. While it is known that this falls short of all actual uses of the surveys, it is believed that it represents a sufficiently large, varied, and important body of uses to provide an informative source for analysis.

In examining the use pattern of the GSSs we ask the standard journalistic litany of inquiries:

Who uses the GSSs?

What variables are used?

When have the uses appeared?

Where have they appeared?

Why have the GSSs been used?

Who

The 1,072 papers in the bibliography have a total of 1,693 authorships; 20 with institutional authors, 599 with single authors, 325 with two authors, 95 with three authors, 28 with four authors, 3 with five authors, and 2 with six authors. Most authors (86.7 percent) are academics with college affiliations. They are followed by associates of research centers, foundations, or associations (7.3 percent), government employees (1.7 percent), journalists and editors (1.5 percent), others (1.1. percent) and unknown (1.7 percent). Among the academics, Sociology predominated (70.6 percent), followed by Political Science (11.6 percent), Business Administration/Management (5.7 percent), Communications (2.8 percent), Criminal Justice and Law (2.0 percent), Psychology (1.8 percent), Medicine/Health (1.6 percent) and others, including anthropologists, statisticians, economists, geographers, educators, etc. (3.9 percent). Within Sociology almost every speciality is covered including gerontology, demography, religious studies, statistical and survey methods, rural and urban studies, cross national comparisons, social deviance, social change, social control, stratification, mobility, etc.

What¹

The counting of variables surveys is a somewhat arbitrary matter depending on how filters are handled, whether several questions are used for determining one variable or one question coded to form several variables, and other matters. The cumulative GSS files currently contain 635 variables. Of these, fully 93 (.146) are not used in any of the papers analyzed here. While this seems like a high number of unused items, it is actually misleading. Of the 93 unused variables, 35 appear only in the 1983 survey, and 40 in only the 1982 (total of 75). There has not yet been sufficient time for these surveys to be widely used by the social science community. (The 1972 survey was used in 422 papers, 1973 in 576, 1974 in 593, 1975 in 505, 1976 in 482, 1977 in 458, 1978 in 315, 1980 in 158, 1982 in 39, and 1983 in 8. The more recent the survey the less opportunity there has been to use it.) Excluding these variables from consideration we find that 18 (.032) of the remaining variables have never been used.

The largest group of 7 unused variables consist of items which appeared in only a single survey: respondent's and spouse's days and shifts of work (SPDAYS, SPHOUR, WORKDY, WORKHR) which appeared in only the 1972 survey, interviewer's ranking of cooperation (COOP2) used in 1972, a variant wording on marijuana legalization (GRASSY) used in 1978, and racial interaction of employer-employee (RACSUPS) used in 1977.

Other (4) of the unused items can be classified as minor, detailed demographics. For example, the four questions about respondent's current religion and religion of origin and spouse's current religion and religion of origin each consist of three variables: the person's major religious group,

¹This section is based on the 976 papers that have been abstracted in the Annotated Bibliography. It excludes the 96 papers in the supplement.

the major denominations of Protestants, and other Protestant denominations not prelisted. While the four religion and four major Protestant denomination variables have been used, one other Protestant variables (SPOTH16) has never been used. Other variables of this type include date of birth (BIRTHDAY), hours normally worked by spouses temporarily not working (SPHRS2), and branch of armed forces (VETKIND).

Finally, the other unused items consist of three trauma items (CHLDDTH, SIBDEATH, UNREL4), two DOT occupation variables (SPDOTPEO, SPDOTTHN), and two filters to the equal rights question (ERAREAD, ERAMEANS).

In general, the unused items tend to deal with minor details, be partly duplicated by other variables, or appear only on a single survey. There are, however, several items whose lack of use is more surprising such as some of the trauma items.

Turning from the wallflowers of the GSS to its cheerleaders, we see in Table 1 a list of the most popular items by question type. Demographics are the most heavily used. The list is headed by education with the other major stratification variables, occupation and income, coming in fourth and fifth. Coming right behind education are the three basic biological attributes: age, race, sex. The top cultural demographic--religion--ranks seventh, followed by the geographic variables--size of place and region--at ninth and tenth, and marital status at eighth. The prevalence of demographics, of course, reflects their standard use as control variables and the first-place finish of education indicated that stratification and SES are still the central concerns of Sociology.

The other three types of items--personal evaluations, attitudes, and behaviors--all have been used less frequently. Personal evaluations are led off by the measures of personal happiness and job satisfaction, followed by

other happiness and satisfaction items. Attitude items are headed by abortion attitudes and the top dozen groups of items include four on race relations, two on crime and punishment, the confidence scale, the Stouffer civil liberty items, the anomia scale, the spending priority items, two on sexual morality, a women's rights item and an item on personal trust. Behavioral and related items are topped by a wide edge by church attendance. Then come group memberships, political participation, socializing, victimization, and gun ownership. It appears that interest has been widely spread among a variety of attitudes, personal evaluations, and behavioral items and that attention has not been overly concentrated in any small substantive area. Reflecting the smorgasbord content of the GSS, the use of variables has been wide-ranging and varied. Perhaps the one area in which usage has been notably light is foreign affairs. The seven national thermometer questions have been used only 7 to 16 times, expectation of war 13 times, support for the United Nations 16 times, and involvement in foreign affairs, 28 times.

When

The GSSs have gained usages with time. There was only a single use in 1972, seven in 1973, 22 in 1974, 50 in 1975, 79 in 1976, 59 in 1977, 143 in 1978, 152 in 1979, 165 in 1980, 151 in 1981, and 106 in 1982, 72 in 1983, and 62 in 1984 or forthcoming and three with dates unknown. The growth of uses reflects several factors, the natural lag time between data collection, analysis, and publication, the addition of more studies with opportunities for trend analysis or pooling, the addition of more questions, and the spreading familiarity of the GSS to the social science community. This growth has continued despite the fact that from 1978 to 1982 the GSS was conducted on a

biennial basis. Our best estimate is that growth levelled-off in 1980-81 at around 175 identifiable usages per annum.¹

Where

Papers using the GSSs have appeared in a wide variety of places. Journal articles lead with 558 occurrences followed by presentations at scholarly meetings with 211, books with 162, reports with 82, and student dissertations and theses with 59. As Table 2 details, most have appeared at conferences or in journals in the field of sociology. Virtually every major sociological and survey research journal has had articles using the GSSs with the Public Opinion Quarterly leading with 47 and closely followed by the Journal of Marriage and the Family (45), the American Sociological Review (32) and Social Forces (28). Outside of sociology, journals using the GSS include such interdisciplinary journals as the Annals and Daedalus, journals in other fields such as business administration (e.g., Personnel Psychology), communications (Journal of Communications and Journal of Broadcasting), political science (American Political Science Review), psychology (American Psychologist), and education (Journal of Research and Development in Education), journals of a popular scientific nature (e.g., Science and Scientific American), and journals of a general political or policy nature (e.g., Public Opinion, The Nation, or Society). In general, use has centered in sociology with secondary concentration in the other social sciences, and peripheral usages in a wide range of fields.

Why

¹Our coverage is least complete for the more recent years. In our analysis of usage in the 1982 edition of the Annotated Bibliography we counted 209 uses for 1972-1977, 140 for 1978, 139 for 1979, 156 for 1980, 134 for 1981, and 92 for 1982 or forthcoming. Our current count shows an increase of

The GSSs have been used for a number of purposes. Most commonly the GSSs have been used to carry out scholarly research in the social sciences on contemporary American society. This research consists of proposing and testing various hypotheses about the organization, operation, and function of various social phenomena, inter-generational studies of mobility and transmittances, trend analyses of social change, cross-national comparisons, and related matters.

In addition the GSSs have been used in social indicators reporting. Data from the GSS were used extensively in Social Indicators III and in publications by the National Center for Educational Statistics, the Law Enforcement Assistance Administration, the U.S. Bureau of the Census, and the National Science Foundation.

The GSSs have also been used to study various questions of survey methodology by using split ballot experiments on wordings and context, various items indexes to examine scaling, and using GSS data to illustrate the application of new statistical methods. Finally, the GSSs have been used as guides of item wording, questionnaire construction, and codebook organization; as a teaching tool for sociology; and as a source for discussions of politics and policy.

Conclusion

From the brief analysis of the usage of the GSSs as reflected in papers employing the GSS, it appears that the surveys are being widely used by a growing number of scholars in sociology and the other social sciences, by the government, and by people in other areas. The GSSs have been used in a large and varied number of places including over 100 different journals by an

4.3 percent for 1972-1977, 2.1 percent for 1978, 9.4 percent for 1979, 5.8 percent for 1980, 15.3 percent for 1981, and 15.2 percent for 1982.

-6-

equally varied and even larger number of authors. The set of scholarly hypotheses tested and trends analyzed has likewise been extremely diverse. With the exception of a few topics and groups where extensive usage has not developed, the GSSs have shown considerable success in providing useful data to the social science community. The prognosis for the future, based on past trends, is for even more extensive and diverse usage in the coming years.
